PROFESSIONAL SUMMARY

Cloud & Application Support Engineer with ~6 years of total experience, including ~4 years in cloud operations across AWS and Azure environments. Experienced in managing production systems, monitoring infrastructure, troubleshooting incidents, and supporting business-critical applications. Strong understanding of cloud infrastructure, access management, and system reliability, with hands-on exposure to automation and DevOps practices.

TECHNICAL SKILLS

- **Cloud Platforms:** AWS (EC2, S3, IAM, VPC, CloudWatch, Auto Scaling, Load Balancer), Azure (AVD, Virtual Machines, VNet, Storage Accounts, Azure AD, Hybrid Identity)
- **Monitoring & Logging:** AWS CloudWatch (logs, metrics, alarms), Azure Monitor, Prometheus, Log Analysis
- **DevOps & Automation:** CI/CD Pipelines (Git, basic Jenkins exposure), Terraform (basic), AWS CloudFormation, Infrastructure as Code (IaC)
- **Networking & Security:** VPC, Subnets, NSGs, VPN, Firewalls, IAM Policies, Role-Based Access Control (RBAC), Least Privilege
- **Operating Systems:** Linux (basic administration), Windows Server
- **Programming/Scripting:** Python (basic scripting), Java, JavaScript
- **ITSM & Practices:** Incident Management, Problem Management, Change Management, SLA, Agile, SDLC

PROJECT HIGHLIGHTS

- Designed and deployed scalable infrastructure using **Amazon EC2**, implementing Auto Scaling and Load Balancing to handle traffic spikes.
- Hosted static websites using **Amazon S3**, including lifecycle policies and secure access configurations.
- Implemented cross-region replication in S3 to achieve high availability and disaster recovery.
- Built event-driven workflows using **AWS Lambda** triggered by S3 events.
- Designed custom networking using VPC, subnets, route tables, and internet gateways for secure architecture.
- Deployed and connected **Amazon RDS** with EC2 for scalable database solutions.
- Configured monitoring dashboards and alarms using **Amazon CloudWatch** for proactive incident detection.
- Implemented IAM roles and policies following least privilege principles.

Certifications

- PG Certificate – **AWS Solutions Architect (SAA-C02)**
  – AWS core services: **EC2, S3, IAM, VPC, Load Balancing, Auto Scaling**
  – Understanding of high availability, scalability, and monitoring concepts
  (Issued: Sep 2022)
- PG Certificate – **Designing Microsoft Azure Infrastructure Solutions (AZ-305)**
  – Azure infrastructure **design fundamentals, storage, networking, and security**
  – Applied knowledge during Azure storage migration and support activities
  (Issued: Feb 2023)

EDUCATION

- **Post Graduation Program – Cloud Computing**, CALTECH CTME – Simplilearn (2023)
- **B.Tech – Mechanical Engineering**, Symbiosis International University (2019)

PROFESSIONAL EXPERIENCE

IDFC First Bank — Cloud Operations Support (Sep 2023 – Jan 2026)

- Managed AWS production environments ensuring 99.9% availability and SLA compliance.
- Reduced incident resolution time by ~30% after analyzing logs and metrics using CloudWatch.
- Automated monitoring and alerting to proactively detect system failures.
- Improved security by implementing IAM roles and least privilege access, reducing unauthorized access risks.
- Collaborated with DevOps, application, and infrastructure teams for issue resolution and deployments.
- Supported change management activities and production releases in controlled environments.
- Contributed to cost optimization and resource utilization tracking.

ETTL — Cloud Engineer (Mar 2022 – Aug 2023)

- Worked and managed cloud migration projects from on-premises to Microsoft Azure environments.
- Worked on Azure Virtual Machines, Storage Accounts, and networking (VNet, NSGs).
- Performed validation, monitoring, and post-migration checks to ensure data integrity and availability.
- Troubleshot infrastructure, connectivity, and access-related issues in cloud environments.
- Used Azure Monitor for tracking performance, logs, and system alerts.
- Created documentation for deployment processes, troubleshooting steps, and operational workflows.
- Coordinated with cross-functional teams to maintain uptime and resolve incidents.

ETTL — Mechanical Engineer (Jan 2020 – Jan 2022)

- Managed operations, documentation, and compliance processes ensuring quality standards.
- Developed strong analytical and problem-solving skills transferable to IT operations.
- Coordinated with stakeholders to ensure timely execution of tasks and reporting.

KEY STRENGTHS

- Strong troubleshooting and incident resolution skills.
- Experience in production support environments.
- Good understanding of cloud infrastructure and monitoring.
- Ability to work with cross-functional teams and stakeholders.
- Continuous learner with growing interest in DevOps and automation.

Key Achievements

- Improved system uptime and reduced downtime through proactive monitoring and alerting.
- Successfully supported production incidents and performed root cause analysis.
- Contributed to cost optimization and resource utilization tracking.

Projects 1: Highly Available Web Application on AWS

- Designed and deployed a highly available web application using Amazon EC2, Auto Scaling, and Load Balancer across multiple Availability Zones.
- Hosted static content on Amazon S3 with lifecycle policies and secure access.
- Configured Amazon RDS for scalable and managed database connectivity.
- Implemented custom VPC with public/private subnets, route tables, and internet gateway.
- Set up monitoring and alerts using Amazon CloudWatch to track CPU utilization and system health.
- Achieved high availability and fault tolerance with minimal downtime.

Project 2: Serverless Automation using Lambda & S3

- Built event-driven architecture using AWS Lambda triggered by S3 events.
- Implemented cross-region replication in S3 for disaster recovery and high availability.
- Automated file processing workflows, reducing manual effort and improving efficiency.
- Designed scalable and cost-effective serverless solution.

Project 3: Monitoring & Alerting System using CloudWatch

- Created CloudWatch dashboards to monitor multiple EC2 instances.
- Configured alarms for CPU utilization thresholds and automated alert notifications.
- Improved incident detection and reduced downtime through proactive monitoring.
